Appendix of All Crosstabs

Weighted pairwise crosstabs for all 276 unique question pairs in the Texas poll

Methodology note

In keeping with the AAPOR Transparency Initiative, any public release of this study should disclose the sponsor and research organization, exact questionnaire wording, population under study, sample source and recruitment method, mode(s) of data collection, field dates, unweighted sample size, weighting variables and targets, data quality procedures, and the general limitations of survey research. The following methodological note is consistent with the Initiative.

This study captures public opinion of a random sample of likely voters in Texas. The survey was sponsored by Texas Public Policy Foundation and conducted by employees of Overton Insights. Respondents were recruited through MMS texts. A total of 1,167 completed interviews is included in the final dataset. Fieldwork was conducted from August 24, 2026 to August 26, 2026. Respondents completed a self-administered online questionnaire in English.

This report presents weighted results and the exact wording of the questions reported. Results were weighted on gender, age, education, and race to reflect the likely voter population in Texas. Survey records were also matched to voter file data to append analytic variables used in reporting, including the geographic breakouts. The margin of error for the full sample is +/- 2.9 percentage points.

Processing and quality. Following raw data collection, the survey was analyzed for duplicates, response speed thresholds, and identity checks. On duplicate responses: the rule-based framework kept only the first response. Any survey completions taking less than 30 seconds were excluded.

On identity checks: responses were specifically tied to individuals through cell phone and an “auth_code” tracking id. No individuals were allowed to show up in the final response dataset more than once. No attention or logic tests were inserted into the survey. Based on the mentioned rules, a total of 235 submissions were excluded, leaving 1,167 complete interviews in the final analytic dataset. Counts excluded at successive, nonoverlapping cleaning steps were: duplicate submissions, 0; completion times under 30 seconds, 0; missing weighting variables, 235; and other exclusions, 0. The reported estimates have not been adjusted for design effects or clustering.

As with all survey research, the results are subject to potential sources of error, including nonresponse bias, coverage limitations, measurement error, weighting effects, and question-wording or order effects.

Each appendix table shows weighted row percentages for the column question within each response category of the row question, plus an overall row for all respondents who answered the row question.
